Reading with evidence

Self-authored interface fixture. Not a published research paper.

1. Start with a question

A paper becomes useful when its mechanism answers a question you care about. Before collecting conclusions, write down the problem, the earlier approach, and the gap the authors try to close.

A highlight is an anchor, not an explanation. Keep the quoted sentence and your interpretation separate. A note should say why the passage matters to the current project.

TRY IT

Select a word or sentence above. Add a note in the right panel, save it, and refresh the page. The quote, page number and highlight should still be there.

From notes to understanding

2. Keep claims and evidence connected

A useful reading summary connects the question, the mechanism and the evidence. It preserves conditions: which data were used, what changed in an ablation, and which metric moved.

Finishing a paper does not resolve every question. Record uncertainty and possible follow-up experiments. A note summary should organize your selected evidence rather than pretend that notes cover the whole paper.

3. Preserve the source version

Notes bind to the PDF hash, page and normalized selection rectangles. If the translated PDF changes, older annotations remain in the notebook and are marked as belonging to the older version.
